End-to-End Information Security

We implement comprehensive protection for executive offices and boardrooms against eavesdropping and unauthorized audio recording.

We block the following technical channels of information leakage:

- Protection against dictaphone recording
- Protection against recording via smartphones and mobile phones
- Protection against radio microphones and hidden "bugs"
- Protection against data extraction via power lines
- Vibroacoustic protection — blocking sound extraction from glass, walls, heating pipes, and other structural surfaces

All equipment is installed covertly — a maximally protected zone is created around the conference table.

The entire system is controlled by a single switch.
Its location is agreed upon with the client.

Over 10 years of expertise in
information security

A team of experts in meeting room
protection

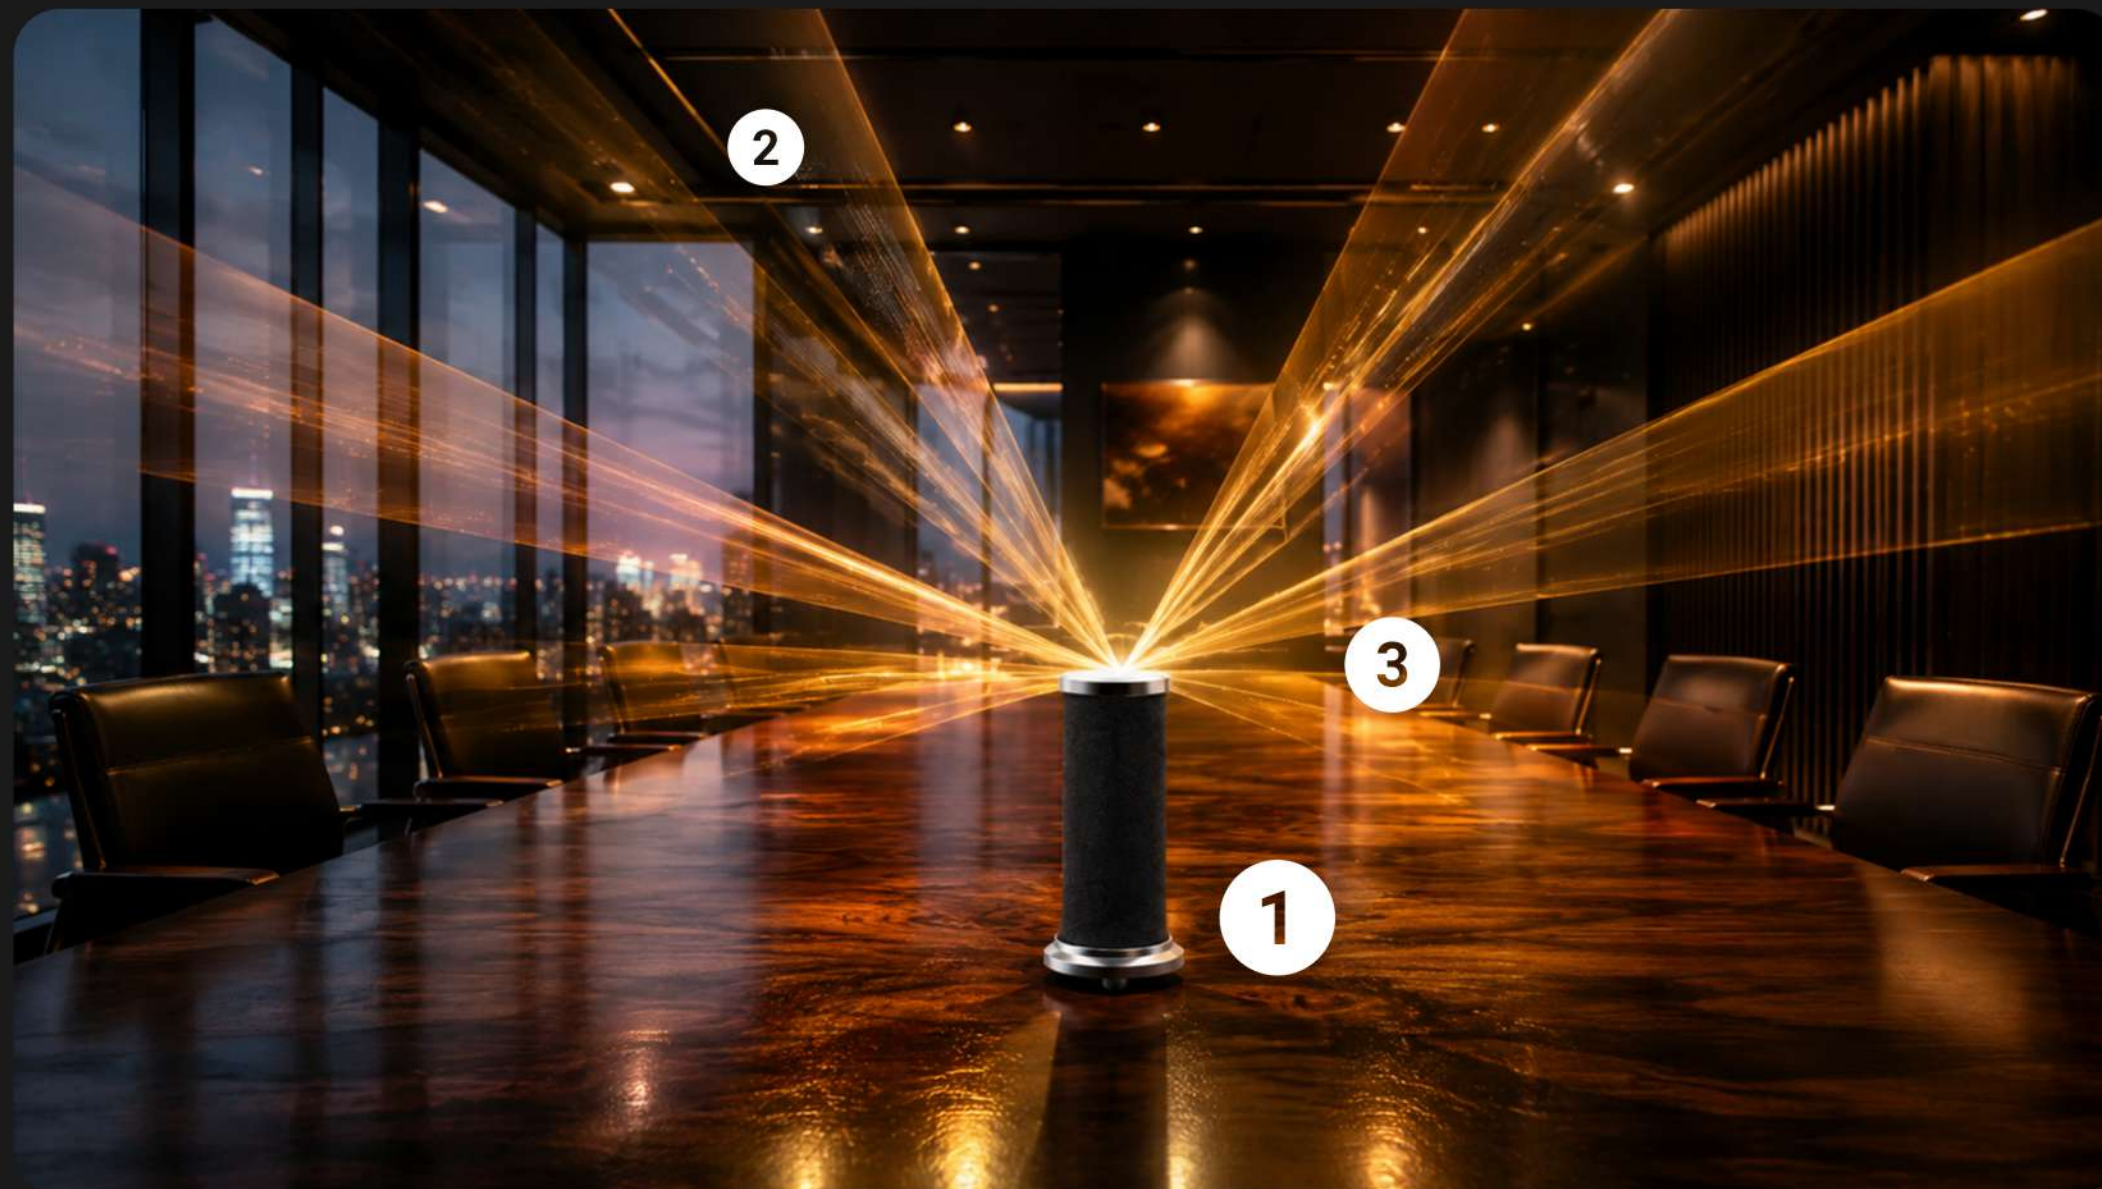

Protection of executive offices and
boardrooms

A complete hardware suite blocking
all possible channels of information
leakage

Warranty on all equipment

Technical support and maintenance
service

How the Protected Zone Works

Part 1: Stationary Protection System Against Dictaphones

The most effective silent protection against dictaphones is built on no fewer than three types of equipment — together, they deliver maximum results. The system combines electromagnetic interference with multiple types of ultrasonic exposure.

Three-Plane Protection

The combination of three types of suppressors operating in different planes delivers top-level silent protection. Ultrasonic and electromagnetic interference work together, while the emitters can be distributed throughout the space — their placement relative to the dictaphone significantly enhances effectiveness.

01.

Desktop Suppressor

Ultrasonic protection above the table — in horizontal and vertical planes.

02.

Ceiling Suppressor

Ultrasonic interference in the vertical plane.

03.

Under-Table Suppressor

Ultrasonic protection in the lower zone + electromagnetic interference for up to 4 participants.

No Signal Will Get Out

Part 2: Radio Microphones, Video Transmitters, Mobile Communications, and Wired Lines

We block all channels through which a signal could escape — from radio microphones and mobile networks to wired power lines.

Channel-Specific Equipment

Each device addresses its own channel.
Together, they leave no path for information to exit the premises.

01.

Phone Microphone Protection

An acoustic safe for 10 phones — silences microphones and dictaphones of guests during negotiations.

02.

Radio Microphone and Video Transmitter Protection

A suppressor or radio monitoring system — blocks the wireless transmission channel of radio microphones and video transmitters.

03.

Mobile, Wi-Fi, Bluetooth, DECT Protection

A wireless communications suppressor for all standards — blocks unauthorized connections to phones and silences transmitters on standard channels.

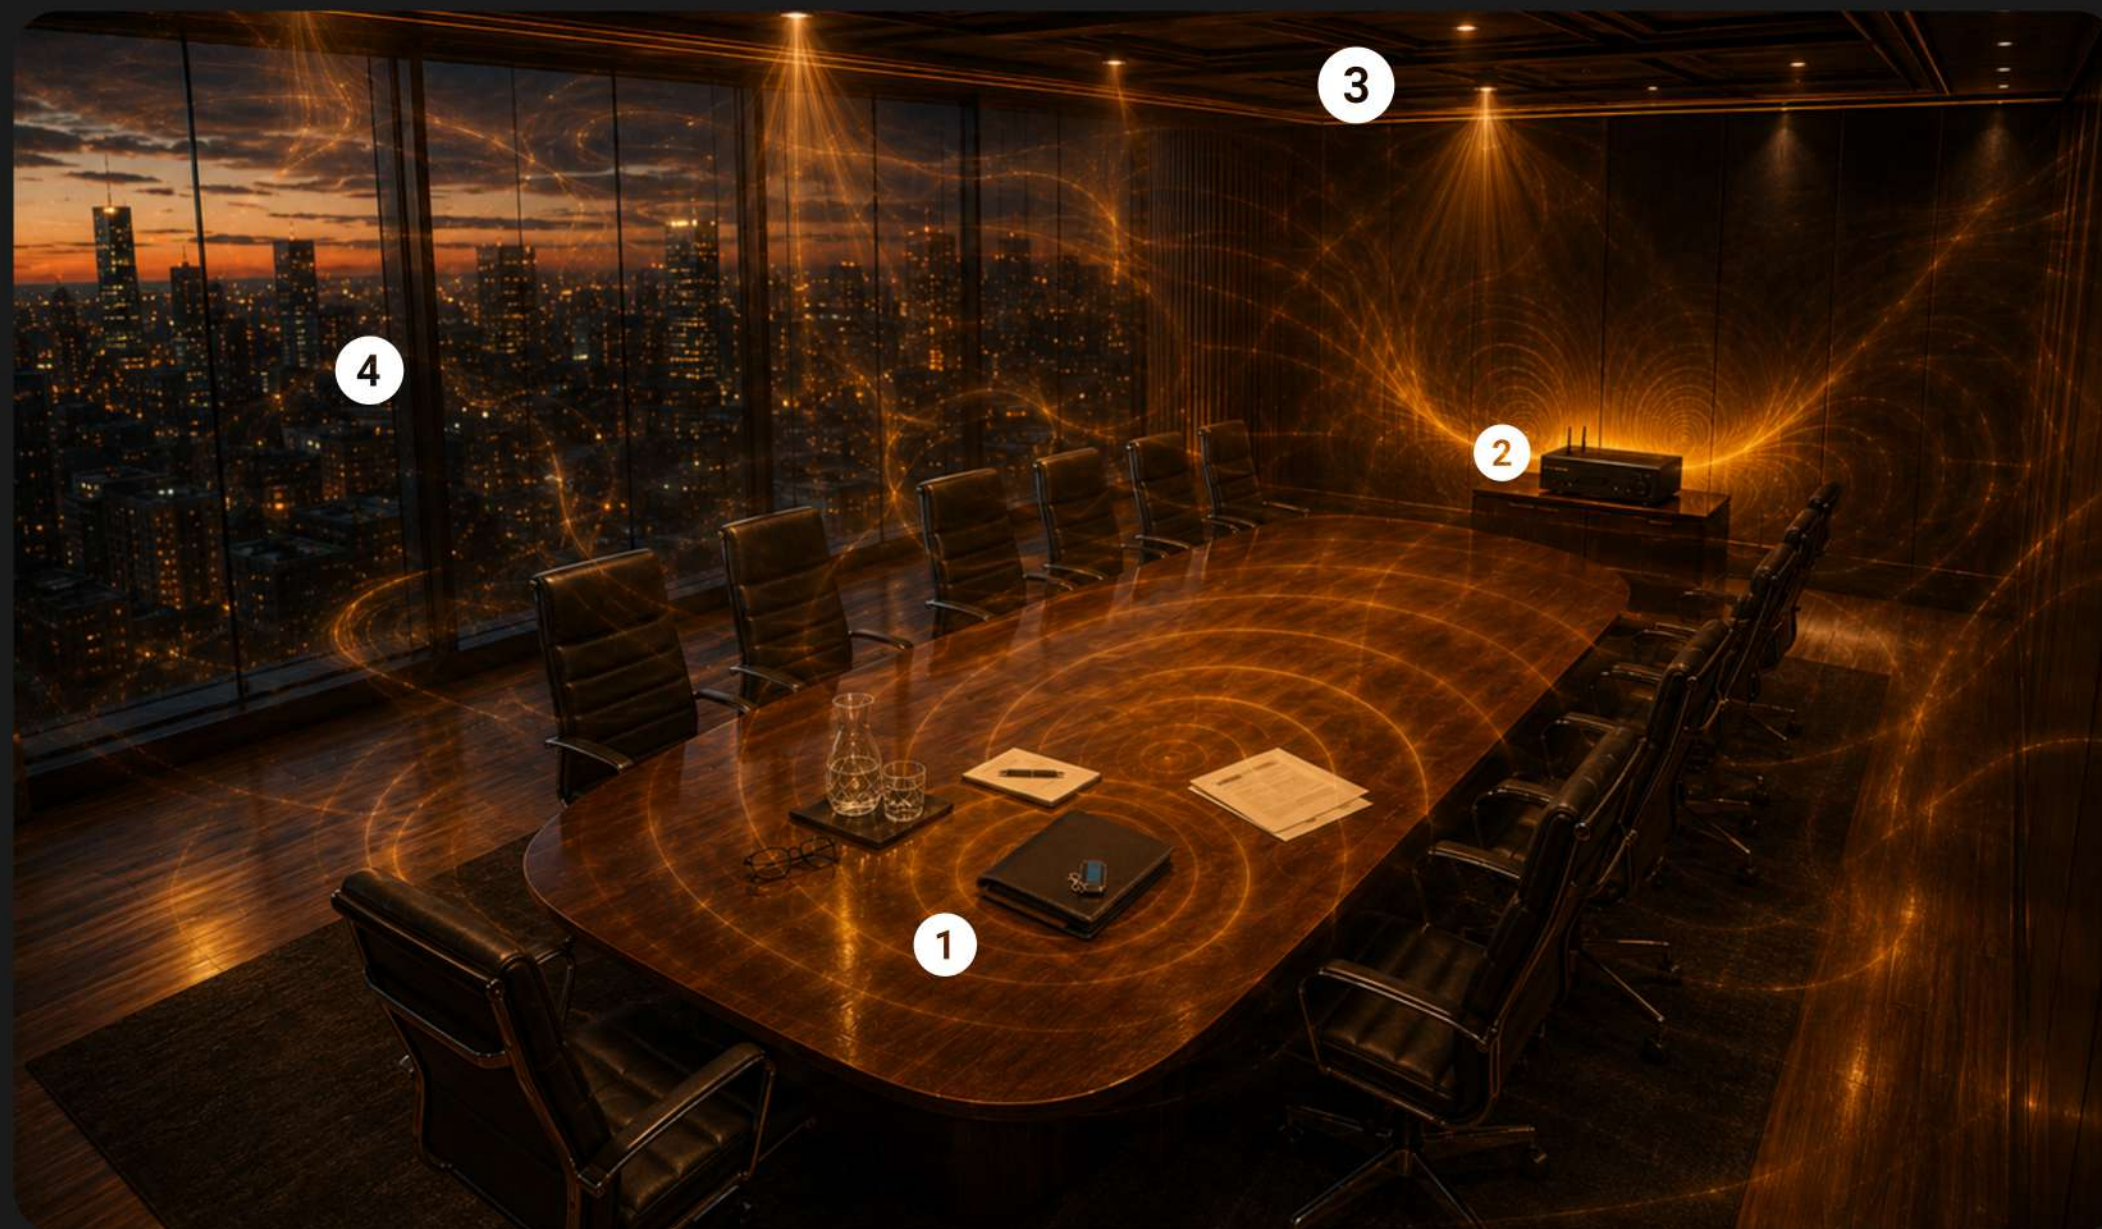

04.

Wired Line Leakage Protection

A 220V network protection device — closes off leakage through power and grounding lines (including from computers).

Vibroacoustic Protection

No Signal Will Get Out

Comprehensive Security: Technical and Informational Protection of Facilities

Signal suppression and transmission jamming devices are just one part of the protection. Offices and boardrooms should be periodically swept for hidden audio, video, and digital recording devices — this requires professional detection equipment.
